

Growth Sickle Cell

1600 7th Ave S • Birmingham, AL 35233 • 205.638.9285 • Hematology/Oncology Clinic 8

Can Sickle Cell Impact Growth?

- Sickle cell can impact how your child develops
- Most children grow normally when they are babies but may grow more slowly after their first birthday.
- Teenagers with sickle cell anemia may go through puberty at an older age. This may impact how tall they are as compared to their classmates
- Some patients with sickle cell disease may also be more thin than other children

Ways to help your child stay healthy:

- It is important to eat a well-balanced diet, including 3 meals and several snacks a day
- It is important to stay well hydrated (water is the best option)
- Limit candy, sodas and junk food
- Folic acid is good for patients with sickle cell anemia. Food with a lot of Folic acid include: leafy green vegetables, cereals and breads.
